## INDIAN RUBBER INSTITUTE DIRI EXAMINATION – 2014

Paper - I Time: 10.00 - 13.00 hrs. Date: 11 July, 2014 Full Marks: 100 **Duration: 3 Hours** Polymer Science Answers should be illustrated with sketches wherever helpful Total FIVE questions are to be answered. From "Group-A" answer THREE questions out of which Question No. 1 is compulsory and From "Group-B" answer TWO questions only. GROUP - A 1. Multiple choice questions: Select the correct answer from the given alternatives: Butyl rubber is a (i) (b) Copolymer (a) Homopolymer (c) Terpolymer (d) Fibre Light scattering is used to determine (b) Weight average molecular weight (a) Viscosity average molecular weight (d) Z-average molecular weight (c) Number average molecular weight Shellac is (iii) (b) Synthetic resin (a) Natural resin (d) Fibre (c) Rubber The polymer having lowest coefficient of friction is (iv) (b) PVC (c) PTFE (d) EPDM (a) NR Ring opening polymerization is related to (v) (a) Isoprene (b) Caprolactam (c) Butadiene (d) Styrene Benzoyl peroxide is an example of (vi) (a) Plasticizer (b) Crosslinking agent (d) Peptizer (c) Initiator Example of an oil resistant polymer is (d) EPDM (b) IIR (c) NBR a) NR (viii) Tg of a polymer can be determined using a

(b) Pyrometer

(d) Calorimeter

(a) Dilatometer

(c) Rheometer

| (ix)     |                              | ration is called "living polymerization"<br>rationic (c) Anionic (d) Condensation |            |  |  |
|----------|------------------------------|---|------------|--|--|
| (x)      | Which one is a transpare     | nt polymer  |            |  |  |
| . ,      | (a) Nylon                    | (b) NR  |            |  |  |
|          | (c) NBR                      | (d) Polystyrene   |            |  |  |
|          | DET:                         |   |            |  |  |
| (xi)     | PET is a                     | 4) 51 4   |            |  |  |
|          | (a) Polyester                | (b) Polyamide   |            |  |  |
|          | (c) Polyolefin               | (d) None of the above   |            |  |  |
| (xii)    | Functionality of propyle     | ne is   |            |  |  |
|          | (a) One                      | (b) Two   |            |  |  |
|          | (c) Three                    | (d) Four  |            |  |  |
|          |                              |   |            |  |  |
| (xiii)   | Cellulose nitrate is an exa  |   |            |  |  |
|          | (a) Natural polymer          | (b) Semi-synthetic polymer  |            |  |  |
|          | (c) Rubber                   | (d) Fibre   |            |  |  |
| (xiv)    | Ziegler Natta catalyst is u  | used for  |            |  |  |
| (AIV)    | (a) Free radical polymeric   | zation (b) Cationic polymerization  |            |  |  |
|          | (a) Anionio nolumenianti     | zation (b) Cationic polymerization  |            |  |  |
|          | (c) Amonic polymerizano      | on (d) Stereospecific polymerization  |            |  |  |
| (xv)     | Cationic polymerization i    | s generally used for making   | n is ther. |  |  |
|          | (a) SBR                      | (b) CR  |            |  |  |
|          | (c) Nitrile rubber           | (d) Butyl rubber  |            |  |  |
|          | .,                           | (4) 243/140001  |            |  |  |
| (xvi)    | Glass transition temperat    | ture of silicone rubber is  |            |  |  |
|          | (a) $+100^{\circ}$ C         | (b) 0°C   |            |  |  |
|          | (c) $-120^{\circ}$ C         | (d) -70°C   |            |  |  |
|          | 700                          |   |            |  |  |
| (xvii)   | The rubber modulus is        |   |            |  |  |
|          | (a) Same as Young's mod      | lulus (b) Stress at specified elongation  |            |  |  |
|          | (c) Ratio of stress by strai | n (d) None of the above.  |            |  |  |
| (xviii)  | Polymer rheology is the se   | cience of   |            |  |  |
| (******) | (a) Crystallinity            | (b) Toxicity  |            |  |  |
|          | (c) Tacticity                |   |            |  |  |
|          | (c) factionly                | (d) Deformation and flow  |            |  |  |
| (xix)    | Solubility parameter of a    | polymer depends on its  |            |  |  |
|          | (a) Polarity                 | (b) Tackiness   |            |  |  |
|          | (c) Modulus                  | (d) Hardness  |            |  |  |
|          |                              |   |            |  |  |
| XX)      | Mechanical properties of     | polymer will be better if   |            |  |  |
|          | (a) Molecular weight distr   | ibution is broader (b) Molecular weight distribution is                           |            |  |  |
|          | narrower (c) Higher molec    | cular weight (d) Glass transition temperature is higher.                          |            |  |  |
|          | ,                            | $(1 \times 20) = 20$  |            |  |  |
|          |                              | (,  |            |  |  |

2.

- (a) Distinguish between homopolymer, copolymer and terpolymer with suitable examples.
- (b) How do you classify polymer based on line structure? Give examples.
- (c) Explain with examples the difference between thermoplastic and thermosetting polymer.
- (d) What is the significance of 'polydispersity'?
- (e) Calculate the number average and the weight average molecular weight from the data shown below:

| i            | Mi                           | Ni                        |
|--------------|------------------------------|---------------------------|
| Interval No. | g/mole of chains in interval | No. of chains in interval |
| 1            | 2,000                        | 2                         |
| 2            | 5,000                        | 4                         |
| 3            | 15,000                       | 5                         |
| 4            | 30,000                       | 3                         |
| 5            | 50,000                       | 2                         |
| 6            | 60,000                       | 1                         |

(3+4+3+4+6) = 20

- 3. Name the polymers used in each case with the structure of the corresponding monomer and
  - (a) A rubber which exhibits very good low temperature flexibility.
  - (b) A rubber which exhibits excellent weather resistant property.
  - (c) A heat resistant rubber.
  - (d) A rubber which shows strain induced crystallization.
  - (e) A polar rubber.

 $(1+3) \times 5 = 20$ 

- 4. Distinguish between the following (with suitable examples):
  - (a) Addition and condensation polymer
  - (b) Natural and synthetic polymer
  - (c) Block and graft copolymer
  - (d) Bulk and solution polymerization
  - (e) Inhibition and retardation

 $(5 \times 4) = 20$ 

## GROUP - B

5

- (a) Write down a typical recipe for hot SBR by emulsion polymerization method and discuss the role of different ingredients used.
- (b) Why this particular technique is often used for making rubbers?
- (c) Explain why this polymerization is stopped much before 100% conversion.

(12+4+4)=20

 (a) What is meant by tacticity in polymers? Explain, with suitable example, the terms: isotactic, syndiotactic and atactic polymer.

(b) What is a co-ordination catalyst? Name any two co-ordination catalysts commonly used.

(c) Why stereo-regular polymers are so important?

(9+6+5) = 20

- 7. Explain the following terms as applied to polymers and rubbers:
  - (a) Stress relaxation and creep
  - (b) Hysteresis
  - (c) Newtonian and non-Newtonian fluid
  - (d) Die swell
  - (e) Viscoelasticity

 $(5 \times 4) = 20$ 

- 8. Write short notes on any four of the following
  - (a) Solubility parameter
  - (b) Suspension polymerization
  - (c) Glass transition temperature and its significance
  - (d) Anionic polymerization
  - (e) Ring opening polymerization
  - (f) Shape factor

 $(4 \times 5) = 20$
